

# Basics of programming

Balázs Goldschmidt

## Indirect reference: pointers

Objektumorientált SW-tervezés © BME IIT, Goldschmidt Balázs

2

## Problem: family tree

- Let's declare a struct for a human

- Store

- ☐ age
- ☐ height
- ☐ father and mother

```
struct human;  
struct human {  
    int age;  
    double height;  
    struct human father, mother;  
};
```

- Size?

- ☐  $|human| = |int| + |double| + 2|human|$
- ☐  $|human| = -(|int| + |double|)$  ☠

3

## Solution: family tree w/ pointers

- Let's store just a **pointer** to parents

- Store

- age
- height
- ptr to parents

```
struct human;
struct human {
    int age;
    double height;
    struct human *father, *mother;
};
```

- Size?

- $|human| = |int| + |double| + 2|human\_ptr|$   
= 20 bytes

4

## Handling pointers

- Pointer definition: type with \*

- `int*`, `double*`, etc.
- `int *i, j, *k;` /\* *i* and *k* are ptrs \*/

- Variables and operators

- \*: value pointed to by pointer (dereferencing)
- &: address of the variable (referencing)

```
int i=1, j=2, k=5;
int *ip, *jp;
ip = &i;
jp = &jp;
k = (*ip)+(*jp);
(*ip) = 12;
```

```
printf("%d\n", *ip);

ip = jp;
(*jp) += 3;
printf("%d\n", *ip);
```

5

## Parameter passing

- Function parameters can be pointers

- less overhead
- data may be corrupted

```
int getMax(int* p, int n) {
    int max = p[0], i;
    for (i = 1; i < n; i++) {
        if (max < p[i]) p[i] = max;
        if (max < p[i]) max = p[i];
    }
    return max;
}
```

Basics of programming © 2012, Dr. Goldschmidt Balázs, BME IIT

6

## Return values

```
int* foo(int* p) {  
    return p;  
}  
  
int a = 13, *b;  
b = foo(&a);  
*b = 10;  
printf("%d\n", a);
```

```
int* bar() {  
    int q;  
    return &q;  
}  
  
int *b;  
b = bar();  
*b = 10;
```

Address to local variables **mustn't** be returned!

7

## Pointer arithmetic

### ■ Operators

- +, -, etc.
- adding *pointer* and *int* results *pointer*
- eg.: `p1 = p0+13;`

### ■ Stepping is type dependent

- `p+1` points to next element (not next byte)
- size is deduced from type of *p*

Basics of programming © 2012, Dr. Goldschmidt Balázs, BME IIT

8

## Arrays and pointers

### ■ Array variables are considered pointers to first element

```
int a[3], *p;  
a[0] = 10;  
a[1] = 20;  
a[2] = 30;  
  
p = a;  
printf("%d\n", p);  
*p = 2;
```

### ■ Array expressions use pointer arithmetic

- `a[x] ≡ *(a+x)`

```
p[2] = 13;  
*(p+1) = 50;  
*(a+2) = 10;
```

9

## Dynamic memory handling

- Allocate single element of type *T*
  - `T *p = (T*) malloc (sizeof(T));`
  - e.g.: *T* is *int*  
`int *p = (int*) malloc (sizeof(int));`
- Allocate array of *T* having *n* elements
  - `T *p = (T*) malloc (n*sizeof(T));`
  - e.g.: *T* is *int*, 10 elements  
`int *p = (int*) malloc (10*sizeof(int));`
- If out of memory, return NULL
  - **NULL** is the pointer that points nowhere

---

---

---

---

---

## Lifetime and deallocation

- All dynamically allocated values exist until deallocated
  - lifetime is longer than a single function call
- Deallocation
  - `free(p);`
  - both for single and array elements

```
int* getN(int n) {  
    return (int*)malloc(n*sizeof(int));  
}  
  
int *p = getN(10);  
p[3] = 12;  
free(p);
```

---

## Resizing dynamic arrays

### ■ Realloc

```
int *tmp, *p = ...;  
tmp = realloc(p, 10*sizeof(int));  
if (tmp != NULL) p = tmp;
```

- has more space after orig: simple allocation
  - pointer remains same
- no more space after orig: reallocation
  - return pointer is new
  - data copied, original freed
- out of memory: returns NULL

## Complex types: strings

Objektumorientált SW-tervezés © BME IIT, Goldschmidt Balázs

13

---

---

---

---

---

---

---

---

## String

- Strings are arrays of characters
  - "abcde" -> {'a', 'b', 'c', 'd', 'e', '\0'}
  - last character is always '\0'
  - string type is char[] or char\*
- String handling functions: *string.h*
  - strcmp, strcpy, strcat, etc.
  - strncmp, strncpy, strncat, etc.
  - strlen

Basics of programming © 2012, Dr. Goldschmidt Balázs, BME IIT

14

---

---

---

---

---

---

---

---

## String exercise

- Implement standard functions
  - int strlen(char\* s1)
    - indexing
    - increment
  - int strcmp(char\* s1, char\* s2)
    - return value
      - -1 if s1<s2
      - 0 if s1==s2
      - +1 if s1>s2
